NETFLIX MANGEMENT SYSTEM

ABSTRACT

The Netflix Management System is a database-based project that manages all the activities of an online video streaming platform like Netflix. The main goal of this system is to store and organize large amounts of data in an efficient and secure way using a Database Management System (DBMS).

This system maintains information about users such as user ID, name, email, password, subscription plan, and payment details. It also stores data related to movies and TV shows including title, genre, language, release year, duration, ratings, and availability status. Each user's viewing history, watchlist, and search activity are stored in the database to provide a personalized experience.

The system allows users to register, log in securely, choose or update subscription plans, and make payments. It helps administrators add, update, or remove movies and shows from the platform. The database uses primary keys and foreign keys to create relationships between users, content, subscriptions, and payments. Normalization is applied to reduce data redundancy and improve performance. SQL queries are used to retrieve information such as popular movies, active users, subscription details, and revenue reports. The Netflix Management System improves efficiency, ensures data accuracy, and supports fast data access, making it suitable for handling a large number of users and streaming content.
